

Neutrino Oscillation Parameters in a Six-Channel **Reduced Rank** See-Saw

G. J. Stephenson, Jr. (UNM)

T. Goldman (LANL)

B.H.J. McKellar (Melbourne)

Based on “**3+2 neutrinos in a see-saw variation**”,
G.J. Stephenson, Jr., T. Goldman, B.H.J. McKellar
and M. Garbutt, to appear in ***IJMPA***
[[hep-ph/0404015](#)]

3 Flavor, Rank 1 Sterile Mass Matrix

Diagonal Dirac mass matrix defines “sterile flavors”

0	0	0	m_1	0	0	v_{af}
0	0	0	0	m_2	0	v_{ag}
0	0	0	0	0	m_3	v_{ah}
m_1	0	0	0	0	0	v_{sf}
0	m_2	0	0	0	0	v_{sg}
0	0	m_3	0	0	0	v_{sh}

Direction of Single Massive Sterile Eigenstate

in space defined by
Dirac mass eigenstates

$$M \longrightarrow M^*$$

$\cos^2 \phi \sin^2 \theta$	$\cos \phi \sin \phi \sin^2 \theta$	$\cos \phi \sin \theta \cos \theta$
$\cos \phi \sin \phi \sin^2 \theta$	$\sin^2 \phi \sin^2 \theta$	$\sin \phi \sin \theta \cos \theta$
$\cos \phi \sin \theta \cos \theta$	$\sin \phi \sin \theta \cos \theta$	$\cos^2 \theta$

Small angles ϕ , θ for
misalignment of sterile and active flavors
nonetheless induce large mixing!

Oscillation Probabilities vs. Time

$$m_1, m_2, m_3 = 1.0, 1.1, 3.0; \theta=9.324078^\circ, \phi=2.25^\circ$$

Large mixing amplitudes to all channels on multiple scales

Oscillation Probabilities vs. Time

$m_1, m_2, m_3 = 1.0, 1.1, 3.0$; $\theta=9.324078^\circ$, $\phi=2.25^\circ$

Variation near source

Oscillation Appearance Probability vs. Time

$$m_1, m_2, m_3 = 1.0, 1.1, 3.0; \theta = 9.324078^\circ, \phi = 2.25^\circ$$

Note probability scale for appearance

Oscillation Probabilities vs. Time

$m_1, m_2, m_3 = 1.0, 1.1, 3.0$; $\theta=9.324^\circ$, $\phi=2.25^\circ$

Effects of finite resolution

Add **CKM** (yes, same as **quarks**) **mixing** in **actives**

m_1	0	0
0	m_2	0
0	0	m_3

[Ignoring CPV]

U_{11}	U_{21}	U_{31}
U_{12}	U_{22}	U_{32}
U_{13}	U_{23}	U_{33}

m_1	0	0
0	m_2	0
0	0	m_3

U_{11}	U_{12}	U_{13}
U_{21}	U_{22}	U_{23}
U_{31}	U_{32}	U_{33}

- Without CKM, L/E scale mismatch for LSND effect
- Transition probability decreases when L/E scale is adjusted to fit atmospheric
- Adding CKM restores probability for ν_e appearance without further L/E scale change

Neutrino Appearance and Disappearance Rates vs. L / E_ν (m / MeV or km / GeV)

Data in L/E form

Oscillation Probabilities vs. Time

$m_1, m_2, m_3 = 1.0, 1.1, 3.0$; $\theta=9.324$, $\phi=2.25$

Non-CKM results on Log-Log plot as for data

Neutrino Appearance and Disappearance Rates

vs. L / E_ν (m / MeV or km / GeV)

Neutrino Appearance and Disappearance Rates

vs. L / E_ν (m / MeV or km / GeV)

Mixing still large -- but too soon?

Remaining questions:

➤ Wolfenstein effect on ν_e through Earth?

➤ Further extend scale for ν_μ disappearance?

➤ Analyze Solar ν 's with multichannel MSW

CONCLUSIONS

1. Sterile and Dirac CKM/MNS angles raise questions re conventional analyses limited in channels
2. Reliable data analysis requires having L/E distributions to avoid two-channel biases.
